Doja Cat Shares Hospital Photos, Reveals Raspy Voice After Undergoing Tonsil Surgery

People all over the world have surgeries. This time famous “Kiss me More” singer, Doja Cat, had a tonsillectomy which is the removal of the tonsils. The operation is used to relieve sleeping problems and to treat recurring infections.

She has updated her fans and followers since the beginning of her first surgery (this one is the second one she has had this year), and has received numerous “Get Well Soon” comments. The Grammy winner also shared a video of herself attempting to rap Nicki Minaj lyrics from Trey Songz’s “Bottoms Up” following the treatment, showcasing her scratchy voice. Countless Doja Cat lovers wished her a fast recovery in the video. The “Kiss Me More” singer insisted she was OK after disclosing explicit descriptions of her procedure. “I wept and it definitely hurt, but I’m Alright,” she explained.

In response to a fan's question about whether she expected to continue vaping, the rapper stated that she was now attempting to give up smoking for good. "I'm giving up vaping for a bit, and perhaps I won't desire it afterwards," Doja Cat continued.

Presumably responding to a similar inquiry regarding vaping from another fan (who has already deleted their tweet), the artist emphasized, "I'm too terrified to hit it since my throat aches so much. It isn't worth it." It is very important to understand that smoking or "vaping" has become someone even kids do and it has long-term consequences.

Vaping is harmful to the heart, lungs and throat. Nicotine is the principal active ingredient in both traditional cigarettes and electronic cigarettes, and it is extremely addictive. It makes you need a cigarette and induces withdrawal effects if you ignore the urge. Nicotine is a poisonous chemical. It elevates your blood pressure and adrenaline levels, increasing your heart rate and your risk of having a heart attack. There is an unmistakable association between smoking, cardiovascular illness and throat injuries, as well as smoking and cancer. However, the sooner you leave it, the faster your body can recover and mend itself.
